

ClinicQueue — Campus Clinic Appointment and Queue Management System

[Problem Statement]

Campus health services rely mostly on walk-in consultations, causing long wait times, overcrowded waiting rooms, and missed classes or work. Patients lack visibility into waiting times, while staff struggle to manage patient flow, organize schedules, and track visits. A centralized digital queue and scheduling system is needed to streamline clinic operations and speed up patient access.

[Objectives]

General Objective

To develop a web-based appointment and queue management system that improves the delivery of campus clinic services.

Specific Objectives

- Allow students, faculty, and staff to book clinic appointments online.
- Enable users to join and monitor a virtual queue remotely.
- Display queue positions and estimated waiting times.
- Help clinic staff manage schedules, patient flow, and visit status.
- Send notifications about appointments, queue updates, and consultation status.
- Maintain secure user records and an audit trail of important system activities.

[Proposed Solution]

ClinicQueue will be a web-based system for students, faculty, staff, clinic personnel, and administrators. Users can create accounts, book consultation slots, join a same-day virtual queue, view their queue status, and cancel or reschedule appointments. The system will provide notifications when an appointment is confirmed or when a user's turn is approaching.

Clinic staff will use a dashboard to manage clinic schedules, call the next patient, record basic visit information, and mark visits as completed or no-show. The system is expected to reduce overcrowding, shorten waiting times, and minimize the time users spend away from class or work.
